

EMAPI Developer's Guide Release Notes 1.6b

This document provides a list of the notable updates implemented between version 1.6a and version 1.6b of the document: *Technical Specifications, EAPI Developer's Guide to the Turquoise Trading System*. This accompanies a new optional release of the EAPI to coincide with the new Turquoise [Competitive Clearing](#) functionality.

Whilst the new information described above can be useful, it is not a mandatory even for who choose to use multiple.

1. Section 11.1.28 - EmapPrivateTradeEvent

Additional attributes *clearingID* and *ccp* will be available in Production from 16th October 2009.

It is not a mandatory requirement for clients to support these values whether they will use multiple clearing firms or not.

2. Section 11.3.14 - EmapOrderEventSubTypes

Additional Order Event Sub Types will be available in Production from 16th October 2009.

3. Miscellaneous

Clients opting to upgrade from an early version of the EAPI (prior to version *20090302_V2_0_2-05*), should ensure that the *EmapOrderbook* (reference data) message is handled correctly after the upgrade takes place, due to a change in structure in the last release. As with all upgrades, we recommend that testing takes place in the Customer Test environment prior to use in Production.

Please contact your Technical Account Manager for any further information.
